Closure domain $G^{\mathrm{auth}}_{\mathrm{claim}}$ and its complement
Inside $G^{\mathrm{auth}}_{\mathrm{claim}}$
29 observables; deterministic mapping closes to PRECISE-or-better tier under Lemmas 1-8.
22 EXACT + 7 PRECISE; 0 contradictions.
Negative controls $\overline{G^{\mathrm{auth}}_{\mathrm{claim}}}$
NC01 m_e_over_m_tau
NC02 m_u_over_m_t
NC03 alpha_xi_value_itself
NC04 QG_UV_cutoff
NC05 string_landscape_vacuum_selection
NC06 supersymmetric_partner_mass_M_susy
NC07 neutrino_absolute_mass_scale
Algorithm must return NO_CLAIM for all 7 controls.
Falsification: if the algorithm assigns any negative control to a closing class, the algorithm falls.
